Play 19, the “Sag Sequence-North Chukchi Basin” play, is the 27th-ranking play (of 29 plays) in the Chukchi Sea OCS Planning Area, with 0.08% (22 Mmboe) of the Planning Area energy endowment (29,041 Mmboe). The overall assessment results of play 19 are shown in [table 1](#). Oil and gas-condensate liquids form 54% of the

hydrocarbon energy endowment of play 19.

[Table 5](#) reports the detailed assessment results by commodity for play 19.

[Table 3](#) summarizes the volumetric input data developed for the *GRASP* computer model of Chukchi Sea play 19. [Table 4](#) reports the risk model used for play 19. The location of play 19 is shown in [figure 1](#).

Potential reservoirs include Eocene and younger marine sandstones deposited in North Chukchi basin during the post-rift thermal or "sag" phase of basin subsidence. Some sandstones in this sequence may be associated with a late Eocene (and younger) regression now marked by an unconformity overlain by Late Oligocene to Miocene strata at 1,041 feet in Popcorn well and widely observed and mapped in seismic data in North Chukchi basin. Prospects include fault traps, faulted anticlines, and diapir-flank traps, the latter in a graben west of Popcorn well. This play is mostly charged by the North Chukchi basin play charging system. Play 19 was tested in a proximal setting by Popcorn well, which encountered only very sparse sandstone in the Eocene sequence (1,041 to 3,235 feet) but abundant sandstones in shallow, unlogged parts of the well above 1,300 feet. Reservoir presence is therefore considered a major risk element for this play.

A maximum of 17 hypothetical pools is forecast by the aggregation of the risk model and the prospect numbers model for play 19. These 17 pools range in mean conditional (un-risked) recoverable volumes from 2 Mmboe (pool rank 17) to 52 Mmboe (pool rank 1). Pool rank 1 ranges in possible conditional recoverable volumes from 7

Mmboe (F95) to 146 Mmboe (F05). [Table 2](#) shows the conditional sizes of the 10 largest pools in play 19.

Table 2

In the computer simulation for play 19 a total of 10,496 “simulation pools” were sampled for size. These simulation pools can be grouped according to the USGS size class system in which sizes double with each successive class. Pool size class 9 contains the largest share (2,268, or 22%) of simulation pools (conditional, technically recoverable BOE resources) for play 19. Pool size class 9 ranges from 8 to 16 Mmboe. The largest 4 simulation pools for play 19 fall within pool size class 15, which ranges in size from 512 to 1,024 Mmboe. [Table 6](#) reports statistics for the simulation pools developed in the GRASP computer model for play 19.
